■ POS tagging

POS = Part-of-Speech

It means the grammatical role of each word in a sentence, like noun, verb, adjective, adverb, etc.

NER

POS = grammar role
noun, verb, adjective...

NER = real-world label
person, country, company...

Bag of words

Bag of Words (BoW) is one of the simplest ways to turn text into numbers.
Bag of Words (BoW) is exactly what CountVectorizer does.

BoW = count how many times each word appears

CountVectorizer = a tool in scikit-learn that creates BoW automatically

CountVectorizer = BoW implementation

Assignment

- For this assignment, you will use the Amazon Fine Food Reviews dataset to apply three NLP tasks: POS tagging, NER, and a simple Bag-of-Words model. You'll run POS and NER with spaCy, then build a BoW representation from the same text using basic Python. Link to the dataset
 - <https://www.kaggle.com/datasets/snap/amazon-fine-food-reviews>

Summary

- ✓ POS tagging — identifying the grammatical role of each word
- ✓ NER — detecting real-world entities like people, places, and organizations
- ✓ Bag of Words — converting text into a simple word-frequency matrix

Thank You
